Answer: C

NO.2 A prison system has historical data on prison inmates and wants to find what factors are related to recidivism (return to prison). What type of model would be used?

- A. Segmentation model
- B. Classification model
- C. Association model
- D. Anomaly model

Answer: B

Explanation:

A classification model is tested by applying it to test data with known target values and comparing the predicted values with the known values.

The test data must be compatible with the data used to build the model and must be prepared in the same way that the build data was prepared. Typically the build data and test data come from the same historical data set. A percentage of the records is used to build the model; the remaining records are used to test the model.

Test metrics are used to assess how accurately the model predicts the known values. If the model performs well and meets the business requirements, it can then be applied to new data to predict the future.
